

ABSTRACT

The invention relates to a make-up composition.

This composition is characterised in that it comprises a polymer or mixture of polymers selected from the family of hydroxylated polydimethylsiloxanes or non-hydroxylated polydimethylsiloxanes, and of their mixtures, and which has a viscoelasticity and a viscosity which are well determined, in order to enable the formation of drops on keratin fibres, said polymer or mixture of polymers being dispersed in a volatile solvent, said composition not containing any product having a viscoelasticity-modifying effect, which can prevent the formation of said drops at the concentration used.

The invention enables drops, which are preferably transparent, to be formed at the tips of keratin fibres, particularly eyelashes or the hair.
